Java Developer

About me

I am a young and ambitious Java developer with a strong foundation in Java Core and the Spring ecosystem. I have hands-on experience with Hibernate and JDBC for working with relational databases.

During my practice, I've implemented authentication and role-based access control using Spring Security and JWT. I also use Redis for basic caching in my projects to improve performance and scalability.

Additionally, I'm comfortable working with Docker and Docker Compose for containerization and managing development environments.

Currently, I'm developing a personal project based on a microservices architecture using Spring Cloud. The system is designed to allow teachers to create tests, which students can then take to earn ranking points. The platform will also feature a ranking system and various achievements to motivate users.

My goal is to offer this project to Simpals and integrate it with Studii.md to enhance the educational experience and provide an engaging learning platform for both teachers and students

Desired industry

- IT, Tech

Education: Higher

State University of Moldova
Currently studying
Faculty: Matematics and Informatics
Speciality: Applied Informatics
